Software Requirement Specification

For

E-Commerce Analytics Dashboard

Prepared by Subhadevi

1. Introduction

The E-Commerce Analytics Dashboard is a web-based interface designed to provide a clear and organized view of key business metrics, including sales performance, product statistics, customer data, and order details.

The purpose of this system is to help users (such as admins or business owners) easily monitor and analyse important information in one place through a visually structured dashboard.

This project focuses on designing a responsive and user-friendly interface using HTML and CSS, without backend integration. It simulates real-world analytics dashboards by presenting data in the form of cards, tables, and visual components such as charts.

The system is divided into multiple sections such as Dashboard, Sales, Products, Orders, Customers, Analytics, and Settings, each providing specific insights for better understanding and decision-making.

2. User Stories

As a user, I want to view an overview of sales, products, orders, and customers on a single dashboard so that I can quickly understand business performance.

As a user, I want to navigate between different sections (Sales, Products, Orders, etc.) using a sidebar so that I can access specific information easily.

As a user, I want to see product details such as stock status and categories so that I can manage inventory effectively.

As a user, I want to view sales data in a visual format so that I can analyse trends and performance.

As a user, I want to view a list of orders and their status so that I can track order progress.

As a user, I want to see customer information so that I can understand customer activity.

As a user, I want a clean and responsive interface so that I can use the dashboard on different screen sizes.

3. Features

3.1 General Features

- Multi-page dashboard layout
- Sidebar navigation for different sections

- Responsive design
- Clean and professional UI

3.2 Dashboard Features

- Overview cards:
  - Total Sales
  - Total Products
  - Orders
  - Customers
- Combined analytics view
- Quick insights section

3.3 Sales Features

- Sales summary display
- Monthly/period-based data representation
- Visual charts (CSS-based)

3.4 Product Features

- Total product count
- Product categories distribution
- Stock status (In stock / Low stock / Out of stock)
- Product performance overview

3.5 Order Features

- Orders table
- Order status tracking (Delivered, Pending, Cancelled)

3.6 Customer Features

- Customer list display
- Basic customer insights

3.7 Analytics Features

- Combined insights from sales and products
- Highlight of key performance indicators

3.8 Settings Features

- User profile UI
- Basic configuration interface
